Porous Polymeric Bioresorbable Scaffolds for Tissue Engineering - Chiara Gualandi 2011-04-07

The development and application of bioactive nano-structured constructs for tissue regeneration is the focus of the research summarised in this thesis. Moreover, a particular focus is the rational use of supercritical carbon dioxide foaming and electrospinning technologies which can lead to innovative polymeric bioresorbable scaffolds made of hydrolysable (both commercial and 'ad-hoc' synthesized) polyesters. Mainly, the author discusses the manipulation of polymer chemical structure and composition to tune scaffold physical properties, and optimization of scaffold 3D architecture by a smart use of both fabrication techniques. The multidisciplinary nature of this research is imperative in pursuing the

challenge of tissue regeneration successfully. One of the strengths of this thesis is the integration of knowledge from chemistry, physics, engineering, materials science and biomedical science which has contributed to setting up new national and international collaborations, while strengthening existing ones.

Tissue Engineering - Daniel Eberli 2010-03-01

The Tissue Engineering approach has major advantages over traditional organ transplantation and circumvents the problem of organ shortage. Coronary Angioplasty - Jagdish S Hiremath 2017-02-06

Coronary angioplasty is a procedure used to widen blocked or narrowed coronary arteries, the main blood vessels supplying the heart. The term 'angioplasty' means using a balloon to stretch open a narrowed or blocked artery. However, most modern angioplasty procedures also involve inserting a short wire-mesh tube, called a stent, into the artery during the procedure. The stent is left in place permanently to allow blood to flow more freely (NHS Choices). This book is a complete guide to the practice of coronary angioplasty for practising cardiologists and trainees.

Beginning with an introduction to the evolution of the technique and the fundamentals of stent design, each of the following chapters provides in depth detail on angioplasty procedures for different disorders. The final sections discuss potential complications, rehabilitation, outcomes, and the future of angioplasty. This comprehensive text is highly illustrated with clinical photographs, diagrams and tables to enhance learning. Key Points Comprehensive guide to coronary angioplasty for clinicians and trainees Describes the complete evolution of the technique, from its beginnings to future developments Covers angioplasty procedures for many different disorders Highly illustrated with clinical photographs, diagrams and tables

Babelsberg/RML - Felgentreff, Tim 2016-07-05

New programming language designs are often evaluated on concrete implementations. However, in order to draw conclusions about the language design from the evaluation of concrete programming languages, these implementations need to be verified against the formalism of the design. To that end, we also have to ensure that the design actually meets its stated goals. A useful tool for the latter has been to create an

executable semantics from a formalism that can execute a test suite of examples. However, this mechanism so far did not allow to verify an implementation against the design. Babelsberg is a new design for a family of object-constraint languages. Recently, we have developed a formal semantics to clarify some issues in the design of those languages. Supplementing this work, we report here on how this formalism is turned into an executable operational semantics using the RML system. Furthermore, we show how we extended the executable semantics to create a framework that can generate test suites for the concrete Babelsberg implementations that provide traceability from the design to the language. Finally, we discuss how these test suites helped us find and correct mistakes in the Babelsberg implementation for JavaScript.

Adverse Reactions to Biomaterials: State of the Art in Biomaterial Risk Assessment, Immunomodulation and In Vitro Models for Biomaterial Testing - Nihal Engin Vrana 2019-05-15

Adverse immune reactions to biomaterials are important bottlenecks for translation of novel biomaterials for clinical use. Moreover, recent advances in highthrough-put biomaterial discovery and synthetic biology, while providing exciting new veues, also significantly increases potential risks related to the in vivo reactions to these new materials. For example, the novel materials might have unintended biological activities due to their natural building blocks. In this perspective, biomaterial field needs i) better understanding of cell/biomaterial interactions at systems level; ii) development of new analysis and testing tools for advanced risk assessment iii) tools and technologies for modulating reactions to biomaterials and iv) advanced in vitro models for understanding and testing of reactions to biomaterials. In the following collection of articles

you will find examples of such systems,together with comprehensive reviews of current developments in in vitro model systems. The collection also contains articles that elucidate the immune reaction to biomaterials in vitro and in vitro.
