Nicolson 2021-06-09
I wasn't looking for love, but Hunter King crashed into my world and flipped it upside down. He's a King alright... a sex on legs and larger than life pro-golfer. A sinful God. And I want to dive into his hypnotic brown eyes. But I'm broken, I'm lost... stuck in a time loop. Waiting for my heart to heal. True to his name, Hunter King decides I'm someone he wants. I'm his hot prey. But I don't want to be caught. And he's not used to being told no. We're from two different worlds. I won't allow him to piece me back together. But I may not have a choice, because my soul craves his. And it makes me question everything. I always thought my heart belonged to another... What if I'm wrong? ****
Hunting Eden is a standalone romance

featuring a gorgeous sports hero who wears his heart on his sleeve, and a beautiful dreamer dancer who's built walls so high around her, you can no longer see her petite frame. It's a perfectly blended full-length romance filled with heat, laughter, emotion, and a HEA, with no cliffhanger. Hunting Eden is Book 1 of The Triple Trouble Series.

Book 2 Coming soon. Authors note: This book touches on sensitive discussions about baby loss and accidental death.

Algebraic Structures of Neutrosophic Triplets, Neutrosophic Duplets, or Neutrosophic Multisets, Volume II - Florentin Smarandache

Neutrosophy (1995) is a new branch of philosophy that studies triads of the form $(, ,)$, where is an entity (i.e., element, concept, idea, theory, logical

proposition, etc.), is the opposite of , while is the neutral (or indeterminate) between them, i.e., neither nor . Based on neutrosophy, the neutrosophic triplets were founded; they have a similar form: $(x, \text{neut}(x), \text{anti}(x))$, that satisfy some axioms, for each element x in a given set. This book contains the successful invited submissions to a special issue of *Symmetry*, reporting on state-of-the-art and recent advancements of neutrosophic triplets, neutrosophic duplets, neutrosophic multisets, and their algebraic structures—that have been defined recently in 2016, but have gained interest from world researchers, and several papers have been published in first rank international journals.

Optimal Control Problems for Partial Differential

Equations on Reticulated Domains - Peter I. Kogut
2011-09-09

In the development of optimal control, the complexity of the systems to which it is applied has increased significantly, becoming an issue in scientific computing. In order to carry out model-reduction on these systems, the authors of this work have developed a method based on asymptotic analysis. Moving from abstract explanations to examples and applications with a focus on structural network problems, they aim at combining techniques of homogenization and approximation. *Optimal Control Problems for Partial Differential Equations on Reticulated Domains* is an excellent reference tool for graduate students, researchers, and practitioners in

Canonical Problems in Scattering and Potential Theory Part II - S.S.

Vinogradov 2002-04-29
Although the analysis of scattering for closed bodies of simple geometric shape is well developed, structures with edges, cavities, or inclusions have seemed, until now, intractable to analytical methods. This two-volume set describes a breakthrough in analytical techniques for accurately determining diffraction from classes of canonical scatterers

Triple Trouble - Martine S Edouard 2020-05-27
"TRIPLE TROUBLE incorporates three short stories specifically aimed at age-school children as its target audience. The author, as a good teacher, skillfully used her book as a teaching tool to increase the academic performance of her students in reading. Without any doubt, those short stories will both contribute to the improvement of their reading skills and provide an excellent education in morals with the purpose of giving them an attraction to useful lessons well suited to their age. Though the author has not provided information about her sources of inspiration to write

this book, one can only imagine that Jean De Lafontaine, the French author of the 17th Century, the Greek fabulist Aesop, the works of other story tellers and folk tales about animals served as source of inspiration for her." Dr. Michel L. Porcena

girl's success are as unlimited as her dreams. Yet societal expectations, cultural trends, and conflicting messages are creating what psychologist and researcher Stephen Hinshaw calls "the Triple Bind." Girls are now expected to excel at "girl skills," achieve "boy goals," and be models of female perfection, 100 percent of the time. Here, Dr. Hinshaw reveals key aspects of the Triple Bind, including • genes, hormones, and the role of biology in confronting the Triple Bind • overscheduled lives and how the high pressure to excel at everything sets girls up for crisis • how traditionally feminine qualities (such as empathy and self-awareness) can put girls at risk for anxiety, depression, and other disorders • the

oversexualization of little girls, preteens, and teenagers • the reasons girls are channeling pressure into violence Combining moving personal stories with extensive research, Dr. Hinshaw provides tools for parents who want to empower their daughters to deal in healthy ways with today's pressures.

The Evolution Problem in General Relativity - Sergiu Klainerman
2002-12-13

The main goal of this work is to revisit the proof of the global stability of Minkowski space by D. Christodoulou and S. Klainerman, [Ch-KI]. We provide a new self-contained proof of the main part of that result, which concerns the full solution of the radiation problem in vacuum, for arbitrary asymptotically flat initial data sets. This

can also be interpreted as a proof of the global stability of the external region of Schwarzschild spacetime. The proof, which is a significant modification of the arguments in [Ch-Kl], is based on a double null foliation of spacetime instead of the mixed null-maximal foliation used in [Ch-Kl]. This approach is more naturally adapted to the radiation features of the Einstein equations and leads to important technical simplifications. In the first chapter we review some basic notions of differential geometry that are systematically used in all the remaining chapters. We then introduce the Einstein equations and the initial data sets and discuss some of the basic features of the initial value problem in general relativity. We shall review, without

proofs, well-established results concerning local and global existence and uniqueness and formulate our main result. The second chapter provides the technical motivation for the proof of our main theorem.

Problems in Quantum Field Theory - François Gelis 2021-08-26

This collection of problems in Quantum Field Theory, accompanied by their complete solutions, aims to bridge the gap between learning the foundational principles and applying them practically. The carefully chosen problems cover a wide range of topics, starting from the foundations of Quantum Field Theory and the traditional methods in perturbation theory, such as LSZ reduction formulas, Feynman diagrams and renormalization.

Separate chapters are devoted to functional methods (bosonic and fermionic path integrals; worldline formalism), to non-Abelian gauge theories (Yang-Mills theory, Quantum Chromodynamics), to the novel techniques for calculating scattering amplitudes and to quantum field theory at finite temperature (including its formulation on the lattice, and extensions to systems out of equilibrium). The problems range from those dealing with QFT formalism itself to problems addressing specific questions of phenomenological relevance, and they span a broad range in difficulty, for graduate students taking their first or second course in QFT.

Analysis - José M. Isidro 2019-12-09
This book is a systematic account of the impressive developments in the theory of symmetric manifolds achieved over the past 50 years. It contains detailed and friendly, but rigorous, proofs of the key results in the theory. Milestones are the study of the group of holomorphic automorphisms of bounded domains in a complex Banach space (Vigué and Upmeyer in the late 1970s), Kaup's theorem on the equivalence of the categories of symmetric Banach manifolds and that of hermitian Jordan triple systems, and the culminating point in the process: the Riemann mapping theorem for complex Banach spaces (Kaup, 1982). This led to the introduction of wide classes of Banach

spaces known as JB*-triples and JBW*-triples whose geometry has been thoroughly studied by several outstanding mathematicians in the late 1980s. The book presents a good example of fruitful interaction between different branches of mathematics, making it attractive for mathematicians interested in various fields such as algebra, differential geometry and, of course, complex and functional analysis.

Forbes Nash, Jr.
2016-07-05

The goal in putting together this unique compilation was to present the current status of the solutions to some of the most essential open problems in pure and applied mathematics. Emphasis is also given to problems in interdisciplinary research for which mathematics plays a key role. This volume comprises highly selected contributions by some of the most eminent mathematicians in the international mathematical community on longstanding problems in very active domains of mathematical research. A joint preface by the two volume editors is followed by a personal farewell to John F. Nash, Jr. written by Michael Th. Rassias. An introduction by Mikhail Gromov highlights some

of Nash's legendary mathematical achievements. The treatment in this book includes open problems in the following fields: algebraic geometry, number theory, analysis, discrete mathematics, PDEs, differential geometry, topology, K-theory, game theory, fluid mechanics, dynamical systems and ergodic theory, cryptography, theoretical computer science, and more. Extensive discussions surrounding the progress made for each problem are designed to reach a wide community of readers, from graduate students and established research mathematicians to physicists, computer scientists, economists, and research scientists who are looking to develop essential and modern new methods and theories to solve a variety of open

problems.

Critical

Literacy/critical

Teaching - Cheryl Dozier
2006

This book describes and documents an exciting new approach to educating literacy teachers. The authors show how to help teachers develop their own critical literacy, while also preparing them to accelerate the literacy learning of struggling readers. The text takes readers inside a literacy lab in a high-poverty urban elementary school, reveals the instructional approach in action, and provides many excellent examples of critically responsive teaching. Featuring a synthesis of several fields of theory and research, this book: illustrates teacher preparation and development as personal and social

transformation - demonstrating that this process requires changing the ways teachers think about students, language, culture, literacy, learning, and themselves as educators; provides pedagogical tools - including the history of the innovative literacy lab, the context of the instructional interactions, and the transition from a university-based to a school-based project; and combines critical and accelerative literacy instruction, showing how teachers can accelerate the slowest developing readers in their classrooms and also build a sense of engagement for students with the social world.

for deep results in combinatorial design theory; this design theory is permeated by problems that were first understood in the context of triple systems and then generalized. Such a rich set of connections has made the study of triple systems an extensive, but sometimes disjointed, field of combinatorics. This book attempts to survey current knowledge on the subject, to gather together common themes, and to provide an accurate portrait of the huge variety of problems and results. Representative samples of the major styles of proof techniques are included, as is a comprehensive bibliography.
